Melotte Cluster Classes

- I. *Globular clusters, condensed at the center, and of which the following may be considered as examples, NGC5139 Omega Centauri, NGC6205 Messier 13 Hercules, NGC6254 Messier 10 Ophiuchi.*
- II. *Loose clusters having a regular, well-defined outline, as for example NGC1245, and NGC2287 Messier 14.*
- III. *Loose clusters, often of a few stars only, and of irregular outline. Most of these are to be found in the richer parts of the galaxy, and it is sometimes difficult to decide whether they should be classed II or III.*
- IV. *Coarse clusters. These are few in number, and include the Pleiades, Hyades, together with some smaller groups which are not included in the above three classes.*
